

DataPA[®] OpenAnalytics v 3.5

Add high-performance Business Intelligence and Reporting quickly and easily

Complete SDK uniquely based on a Progress-focused development environment

Timely, on-demand information has never been so critical to the survival of business. Organisations therefore demand more value from Business Intelligence and Reporting applications than ever before.

DataPA OpenAnalytics for Progress is the industry-leading solution for real-time, high performance Business Intelligence and Reporting that can be deployed and scaled within existing IT infrastructures with unparalleled ease and speed. Through DataPA OpenAnalytics v3.5 we continue to deliver our customers forward-thinking functionality designed to meet the vast information demands of enterprise-wide users who demand better information, faster and more cost-effectively.

What's new with DataPA OpenAnalytics v3.5?

- > **DataPA Web Service:** Available through DataPA Enterprise, DataPA Web Service offers end users and third parties the ability to collaborate and communicate directly and securely in real-time and at low cost through XML data feeds.
Uniquely, DataPA's Web Service can be configured so that end users can quickly and easily create their own business intelligence and reporting queries, test them in excel, and then publish them as a secure data feed to a third party; and in doing so, alleviate demands on IT staff for time-consuming data extracts to be written.
- > **DataPA Embedded Client Server:** Add the benefits of low-cost embedded reporting without incurring the overhead of maintaining an AppServer. DataPA's new Embedded Client Server now offers ISVs a new option of direct database access with reporting functionality that includes user creation and customisation of System Reports and Documents such as stock listings, work orders and invoices.
- > **Automatic multi tenancy control and the ability to save reports without data:** Offer increased data protection support through automatic multi tenancy control and/or equally through report storage options that save reports without data.
- > **Report automation and Trigger alerts:** Increase business agility and reduce manpower demands by enabling your customers to respond effectively with features such as remote task automation, and trigger alerts. This new functionality is available through the Data Scheduler making it easier than ever to run and automate commands on completion of jobs such as Start of load processes, Copying of files to

locations, Sending of text messages or Importing data into any other Database .

- > **New tools to empower end users and enhance productivity:**
 - > Let end users test and explore new data search paths quickly by themselves through an "Explore" feature that limits the volume of records retrieved for newly created queries.
 - > Reduce workloads for end users through rich text object support that enables existing RTF documents to be re-used within DataPA.
 - > Offer users greater choice over which data types can be incorporated into reports through LOB field support for data intense applications such as graphics.
 - > Give users more control over presentation options through an inner join option for multi-level queries that enable end users to control the data entries that appear on final reports
- > **Shortcut the effort in controlling multiple systems with DataPA's Command Line Switch for Data Location**
New ways of making the development process easier for ISVs are always top of the agenda so with OpenAnalytics v3.5, the command line switch is a welcome feature which now enables different systems to be accessed directly with their own shortcuts.

Typical business applications for DataPA OpenAnalytics:

- > ISV-Embedded reporting
- > User-customised reporting and business intelligence
- > Centrally-managed business intelligence
- > Real-time, self-service business intelligence

Business Benefits of DataPA OpenAnalytics for ISVs:

- > Increase competitive advantage with a superior, high performance Business Intelligence and Reporting offering.
- > Reduce development time, risk and cost with a proven, Progress-focused solution.
- > Boost revenue by providing valuable, enterprise-wide reporting and analysis functionality.
- > Reduce overheads by handing value-added services and control directly into the hands of end users.
