

DataPA®

## DataPA provides reporting in hospitals across Europe

**DataSwiss a leading software developer with more than 25 years experience covering all fields of in-patient and outpatient medical care, have installed DataPA into hospitals across Switzerland and Germany as the default report solution for their Healthcare Information System, SwissCare®.**

SwissCare® is a user-friendly solution for all administrative processes within a healthcare facility. The system is designed to run in large, medium and small organisations with cost models to suit each. One of the key requirements in order to satisfy this model is the ability to supply SwissCare® as a service across the internet. To enable this functionality, DataSwiss were one of the first companies worldwide to adopt Progress Dynamics as their key development architecture. It wasn't until they came across DataPA that they finally came across a complete reporting solution that fulfilled all their requirements for SwissCare®.

**“One of the first things that attracted us to DataPA was it's ability to run across the AppServer”**

Frank Mainzer, CTO for DataSwiss

### Reduced Development Effort

DataPA uses Progress AppServer technology to provide database connectivity. This not only gives it significant performance advantages over its competitors, but allows reports to be run across almost any network including the internet. For DataSwiss this functionality was crucial as it fitted with their model of SwissCare® as a service.

**“Not only can we create reports in a fraction of the time it previously took, we can build data sets that were just impossible with our previous solution”**

Frank Mainzer, CTO for DataSwiss

The use of the AppServer not only improves performance, it allows DataPA to use your existing business logic and application security. This was also a significant advantage for DataSwiss as DataPA inherited all the existing business logic and security from the application, vastly reducing the time it took to re-create all their reports.

For application developers like DataSwiss, DataPA provides a framework to imbue the reporting functionality. The result for DataSwiss is the seamless integration of DataPA into SwissCare®. In fact, the end user would probably not be aware there was any distinction.

**DataPA fully integrates with Progress Dynamics version 2.1 and above and supports reports generated directly from Dynamic SmartDataObjects.**

**“The final integration between DataPA and SwissCare® is seamless, and the work DataPA have done to ensure DataPA can be updated on each client simply and automatically from the server in the same way as our WebClient application was the icing on the cake”**

Frank Mainzer, CTO for DataSwiss

Rather than forcing users to learn new skills to present their data, DataPA supports a host of windows based applications such as DataPA Reports, DataPA Dashboard, Crystal Reports, Excel and Access. Combined with the simple data access, this allows users to be up and running creating reports in less than a day.

**“DataPA provided us originally with Crystal, Excel and Access interfaces, and with their help we have been able to extend this to include Word and XML with only a few days work”**

Frank Mainzer, CTO for DataSwiss

DataPA are actively marketing worldwide and predicting significant growth over the next twelve months. The company has recently secured a significant investment from a private equity group to support the expansion of commercial activities surrounding the product.

Bedford, Mass - The Progress Company, a business unit of Progress Software Corporation (Nasdaq: PRGS) and a leading supplier of technology for building e-business solutions, announced today that leading global healthcare solution provider, DataSwiss Solutions AG, has developed their new SwissCare® application using Progress Dynamics™ in less than half the time expected.
